

P1:

Problem:

Shreya feels conflicted, unsure about ethics, and doubtful about her learning after using AI.

WHY 1: Why does she feel conflicted?

- (1A) Unclear if AI use = help or cheating
- (1B) Doesn't feel full ownership of the work
- (1C) Fear of being caught

WHY 2 (branching from WHY 1):

- From (1A): Why is AI use unclear?
 - No clear institutional guidelines
 - Everyone uses it differently
- From (1B): Why doesn't she feel ownership?
 - AI generates most of the draft
 - Her contribution is mostly editing
- From (1C): Why fear being caught?
 - No clarity on what is allowed
 - Detection systems feel unpredictable

WHY 3 (continue branching):

- From “No clear institutional guidelines”
 - Universities haven’t defined acceptable AI use
- From “AI generates most of the draft”
 - AI produces high-quality output instantly
- From “Detection feels unpredictable”
 - Lack of transparency in AI detection tools

WHY 4:

- From “Universities haven’t defined rules”
 - AI adoption is faster than policy-making
- From “AI produces high-quality output instantly”
 - Models are optimized for polished answers, not learning
- From “Lack of transparency in detection”
 - Institutions rely on imperfect tools

WHY 5 (converging root cause):

All branches point to: (ROOT CAUSE)

The system (education + AI tools) prioritizes output and speed, without providing clear guidance, transparency, or support for learning-focused use.

P2:

Problem Statement

Rahul uses AI to improve productivity, but due to low trust and high accountability, he spends significant time verifying and fixing outputs, making AI feel like partial help rather than a true efficiency gain, leading to mild frustration and fatigue.

WHY 1: Why doesn't AI feel like a true efficiency gain?

- (1A) He has to review everything manually
- (1B) He doesn't trust AI outputs
- (1C) He remains fully accountable for errors

WHY 2:

From (1A): Why does he review everything manually?

- AI outputs can contain subtle bugs
- Errors are not clearly highlighted

From (1B): Why doesn't he trust AI?

- AI appears confident even when wrong
- No visibility into reasoning

From (1C): Why is accountability fully on him?

- AI is just a tool, not responsible
- Work quality directly impacts his job

WHY 3:

From “AI outputs have subtle bugs”

AI optimizes for plausible code, not guaranteed correctness

From “AI appears confident when wrong”

No confidence indicators or uncertainty signals

From “AI is just a tool”

No built-in validation or guarantees from the system

WHY 4:

From “Plausible, not correct”

Models are trained on patterns, not execution validation

From “No uncertainty signals”

AI UX prioritizes smooth output over transparency

From “No built-in validation”

Tools are not integrated with testing/debug pipelines

WHY 5 (Root Cause – Converged):

AI systems are designed for generation, not verification, while professional environments require reliability, accountability, and correctness.

P3:

Problem:

Dr. Neha avoids using AI for high-stakes decisions because low trust, ethical risk, and lack of reliability make it feel unsafe, limiting AI to minor tasks and preventing meaningful adoption despite potential benefits.

WHY 1: Why does she avoid AI for critical use?

- (1A) She doesn't trust AI in high-stakes situations
- (1B) Risk of harm is too high
- (1C) AI oversteps into areas it shouldn't

WHY 2:

From (1A): Why doesn't she trust AI?

- AI can be incorrect or inconsistent
- It presents outputs confidently

From (1B): Why is risk too high?

- Decisions directly impact patient safety
- Errors have serious consequences

From (1C): Why does AI overstep?

- AI gives clinical suggestions without boundaries
- No clear separation between safe vs unsafe use

WHY 3:

- From “AI can be incorrect”
 - No guaranteed reliability or validation
- From “Errors have serious consequences”
 - Professional responsibility lies fully on her
- From “No clear separation of use”
 - AI lacks domain-specific constraints

WHY 4:

- From “No guaranteed reliability”
 - AI is probabilistic, not deterministic
- From “Responsibility lies on her”
 - Systems don’t share or support accountability
- From “Lack of domain constraints”
 - Tools are designed as general-purpose systems

WHY 5 (Root Cause – Converged):

AI systems are not designed for high-stakes, safety-critical environments where reliability, accountability, and strict boundaries are essential.

P4:

Problem:

Amit uses AI for quick tasks but avoids relying on it for important decisions because he cannot fully trust its accuracy, leading him to cross-check outputs and limit usage, which reduces efficiency and confidence.

WHY 1: Why does he not trust AI for important decisions?

- (1A) Cannot verify if AI answers are correct
- (1B) Feels unsure relying on AI
- (1C) AI sounds too confident
- (1D) Still needs to Google after asking AI

WHY 2:

- From (1A): Why can't he verify AI answers?
 - Answers often lack sources or references
- From (1B): Why does he feel unsure relying on AI?
 - Fear of misinformation or wrong advice
- From (1C): Why does AI feel too confident?
 - No warning when answers may be uncertain
- From (1D): Why does he still Google after AI?
 - Cross-checking adds extra steps

WHY 3:

From “Answers lack sources”

No clear proof of where information comes from

From “Fear of misinformation”

Mistakes could waste time, money, or cause embarrassment

From “No warning for uncertainty”

Confidence feels fake or risky

From “Cross-checking adds steps”

Traditional methods feel easier

WHY 4:

From “No clear proof of source”

AI lacks transparency and evidence signals

From “Mistakes have consequences”

AI does not create psychological safety

From “Confidence feels fake”

No confidence indicators or honest uncertainty cues

From “Traditional methods feel easier”

AI fails to save effort consistently

WHY 5 (Root Cause – Converged):

AI does not communicate trustworthiness effectively through transparency, uncertainty cues, and reliable validation signals.
